

Vector rotary latches offer concealed latch points with convenient push-to-close action. Vector Rotaries are suitable for a variety of applications that require high strength, robust and secure latching. They are employed either as single latch point or in a multipoint latching system. Available in either single or two stage latching. The two stage rotary offers a safety feature that securely latches a partially latched compartment. Specially engineered to offer minimized trigger release force that ensures smooth and easy opening.

Vector rotaries are combined with Vector actuators that connect to the rotary latch by Vector rods or cables, creating an optimized latching system with components easily and securely fitted together. Please see related products to choose your components for your complete Vector rotary latching system.
